

ShopFlow — E-Commerce Website

Build a small e-commerce website called **ShopFlow** using **HTML, CSS, and JavaScript**.

The website should allow users to browse products, search and filter products, view product details, add products to favorites and manage a shopping cart.

The project should contain **at least 5 pages**:

1. **Home** — featured products and store overview.
2. **Products** — list of products with search, filtering, and sorting.
3. **Product Details** — complete information about a selected product.
4. **Cart** — selected products, quantities, and total price.
5. **Checkout / Orders** — customer information, simulated checkout, and previous orders.

Requirements

- Products must be loaded from a **public API**.
- Favorites and cart data must persist using **browser storage**.
- Users should be able to complete a **fake checkout** and save their orders.
- Support **Light / Dark Mode**.
- The website must be **responsive**.
- Handle basic **loading, empty, and error states**.

Important

You are responsible for analyzing the requirements and deciding the exact page structure, data structure, JavaScript organization, and user flow.

The goal is not only to create a good-looking interface, but to build a **working multi-page application**.
